

slide's module standard is s...
 my first version: entities are boxes with the
 name on top and attributes below, and the
 lines carry multiplicities like 1 and 0..*.
 Here's the diagram redrawn in that style.

How to read it with ↓ slide's guide

to read it with your slide's g

The number sits next to the box it describes, and it answers "how many of this box are on that end?"

- **Owner "1..*" – "0..*" Pet**: a pet has one or more owners, and an owner has zero or more pets. This is the "which people own which pets" requirement.
- **Address "1" – "0..*" Pet**: a pet lives at exactly one address, and an address can house zero or more pets.
- **AnimalType "1" – "0..*" Pet**: a pet is exactly one type of animal (dog, cat...), and a type can cover zero or more pets.

Steps to draw it yourself

1. Draw a rectangle for each noun: Owner.

4. At each end of the line, write the

Let's design a database

INFORMATION
REQUIREMENTS

- Keep track of which people own which pets
- Capture the names of the owners, the names of the pets, photos of the pets, the addresses where the pets live, & what type of animal each pet is

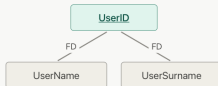

calculating coordinates and label

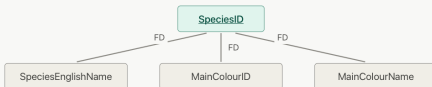

Here are the three final diagrams, one for each 2NF table.

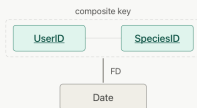

1. User table

2. Species table

3. Sighting table

Here is how to copy these onto paper:

- **Keys:** Underline the key attributes

(UserID, SpeciesID, and both fields in the
